

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently Amended) An adjustable wrench for quickly adjusting the width of a jaw, comprising:

a stationary body having a chamber at an upper portion thereof;

a movable body having a worm at a lower portion thereof, being movable transversely inside the chamber;

a driving mechanism located within the chamber, including:

a worm gear with a worm gear shaft, engaging the worm,

a first gear mounted at an end of the worm gear shaft of the worm gear,

a connection shaft located under the worm gear shaft in parallel, and

a second gear mounted at an end of the connection shaft to engage with the first gear; and

a traction mechanism connected to the connection shaft, wherein the traction mechanism drives the second gear to rotate by driving the connection shaft, which drives the first gear to rotate, thereby rendering the worm to move inside the chamber, and wherein the driving mechanism further includes two joint flakes for integrating the worm gear and the driving mechanism and holes provided in corresponding positions of each of the joint flakes, respectively, so that both ends of the worm gear shaft and those of the connection shaft can be rotatably installed in the holes.

2. (Canceled)

3. (Previously Presented) The adjustable wrench of claim 1, wherein the stationary body includes an elongated cavity positioned at a side of a handle of the stationary

body, and the traction mechanism includes a guiding wheel disposed within the elongated cavity away from the chamber and a driving rope connected to the connection shaft via the guiding wheel.

4. (Previously Presented) The adjustable wrench of claim 3, wherein the driving rope, with an end thereof, is tightly wound around the connection shaft in a direction, and is tightly wound around the connection shaft in an opposite direction with another end thereof, after wrapped around the guiding wheel.

5. (Previously Presented) The adjustable wrench of claim 4, wherein the driving rope is made of materials with a high strength and slight flexibility.

6. (Previously Presented) The adjustable wrench of claim 4, wherein a control button is provided at a section of the driving rope.

7. (Previously Presented) The adjustable wrench of claim 6, wherein the traction mechanism further includes a cover plate for covering the chamber and the elongated cavity, having a shape corresponding to a peripheral shape of the chamber and the elongated cavity, an elongated slot is provided at the cover plate for exposing the control button, and the cover plate is secured at the stationary body by a joint member.

8. (Previously Presented) The adjustable wrench of claim 7, wherein the joint member includes screw bores disposed at the cover plate and the stationary body, respectively, and screws or bolts matched with the screw bores.

9. (Previously Presented) The adjustable wrench of claim 1, wherein a through hole is provided at the handle.
